

APPS Plus

USS984 Automated Print Processing System Plus

United Systems and Software, Inc. (USSI), announces the availability of USS984; Automated Print Processing System (APPS).

APPS operates in conjunction with the IBM AS/400 or IBM e-server iSeries machines, and an IBM compatible PC running Microsoft® Word to provide a simple method, whereby text and variable data may be merged producing a completed document.

APPS allows the user to define the text of the document in Microsoft Word, including the location and attributes of variable information. The user can then access the relational database to retrieve required variable data. Finally, APPS merges text and variable data, producing the final document.

The user may create an unlimited number of forms and may have up to 700 variables identified within each form.

APPS is ideally suited for use in creation of most typical insurance industry policy forms and other documents.

Product Description

APPS is a PC resident product that provides a user friendly interface for those who wish to combine data elements, that may be found in the relational database, with text created in Microsoft Word in order to create a completed document.

There are two distinct aspects to APPS - Setup and Execution.

During Setup, the user defines the document text using Microsoft Word; including areas in the document where variable data will be required. The user defines the maximum length and characteristics of each variable. The user may also define which forms are to appear in the completed document. In other words, an insurance policy may require from one to ten different forms depending on the type of policy.

APPS allows the user to select what forms are to be placed together and in what order. Variable data will be provided from the database, as defined by the user when APPS Setup was accomplished.

During Execution, APPS locates the user-defined document number, pulls in the required forms, as defined by the user, and merges the variable data with each form creating and printing the final and complete document.

APPS is ideally suited for the printing of lengthy documents, such as: insurance policy contracts, loan documents, agreements and other legal documents.
